Novawall

Stretch Wall Fabric System

The Novawall system represents a site-fabricated stretch fabric solution designed for acoustical, and visually appealing architectural purposes. It finds its niche in diverse venues such as commercial office spaces, auditoriums, critical listening environments, educational facilities, hospitality areas, and healthcare interiors. With its adaptability to ceilings and walls, Novawall offers a versatile solution adaptable to various spatial requirements.

Consisting of three essential components, the Novawall system ensures a harmonious blend of functionality and aesthetics. It features an extruded PVC-free Polymer track available in different edge variants, a core material tailored to specific applications, and the option for commercial-grade panel fabrics. Notably, Novawall systems engineered with this approach can achieve a Noise Reduction Coefficient (NRC) ranging from 0.10 to 1.0, depending on the selected core material.

FEATURES:

- Installation Flexibility
- Design Flexibility
- Site Fabrication
- Easy Maintenance
- Wide Range of Fabrics
